

Analemma material specifications:

- Stainless steel holder
- Stainless steel or wooden housing
- Crystal glass water wand
- Full spectrum coherent water
- Silicone cap
- Wand dimensions: 16 x 1 cm

We recommend always using the Analemma Water Wand as described in the user manual. Stir the wand for the correct amount of time — for example, if you are treating a 1-liter container, make sure you treat the water for at least 40-50 seconds. You can use this measurement to calculate the treatment time for other quantities of water.

If in doubt, please contact us for further clarification.

ANALEMMA

THE ARCHITECT OF LIFE

About Analemma

Product information

This product consists of a quartz glass wall filled with full spectrum coherent water and finished with a stainless steel handle. The glass wall is fully protected with a stainless steel or wooden casing, depending on the model chosen. This product is intended for personal use and not for industrial or commercial purposes.

Before using this product

Upon delivery of the product, inspect it for any damage. Minor scratches may occur during production, but these will not affect the functioning of Analemma.

If you think there is any serious damage, please contact our customer service and we will assist you further. Please also include a photo of the product in your email.

When making Analemma water, all water is first carefully filtered. Because water is a bipolar pool of molecules, clusters of minerals are formed during the coherence process.

When the clusters become large enough, they can form small but visible particles. To remove the particles, we would have to use a very specific filter that would disrupt the coherent state of the water. The particles do not disrupt or affect the efficiency of the water in any way.

However, if you see large particles in your Analemma, please send a photo of your product to our customer service team and they will assist you further.

Use with drinking water

We recommend using Analemma with high-quality filtered water intended for human consumption, free from chemical and biological contaminants. You can use tap water if it has been deemed safe for human consumption.

Other applications

Analemma can also be used for cooking, animal feed, and watering indoor and outdoor plants. For larger quantities of water, you should extend the treatment time.

You can also treat juices, milk, and other beverages with it.

Analemma – The Architect of Life
At the molecular level, the quality of the water you consume affects the quality of your life. Analemma transforms the configuration of water and brings it into a state of coherent harmony. Analemma as the architect of life.

How to use this product Please read the instructions carefully.

1. Unscrew the protective cap from the handle.

2. Immerse the Analemma in water and stir. The treatment time depends on the amount of water you are treating. For example, if you are treating 1 liter, make sure you stir for at least 40-50 seconds. You can use this time to calculate the treatment time for other quantities of water

The handle contains threads which can be screwed onto the holder to extend your Analemma for use in pitchers.

Also, make sure that the handle does not come into contact with water, as this will prevent the adhesive that holds the handle to the quartz glass from coming loose.

3. Store your Analemma in a dry place. Make sure to keep it clean and dry. Do not touch the glass with dirty fingers. Use a clean, dry cloth to clean it. Do not use aggressive cleaning agents and do not wash the Analemma in a dishwasher, as this may cause damage.

4. The wall is made of quartz glass, a very fragile material that cannot withstand high pressure or high temperatures. To prevent breakage, keep the Water Wand away from children and animals. If your Analemma falls, there is a high chance that it will break. Make sure you do not drop it, as even the protective cover will not prevent it from breaking if dropped.

5. We recommend not immersing the wand in hot liquids, as this may cause breakage. At temperatures above 65 degrees Celsius, the structure may be temporarily damaged, but it will repair itself once the water cools down.

6. Store Analemma in a dark, dry place at room temperature, preferably not below 4 degrees Celsius. Avoid prolonged exposure to direct heat sources or freezing temperatures as this will cause damage to the quartz glass.

7. Do not use the Analemma completely submerged for prolonged periods of time. This will lead to dissolution of the glue used to attach the handle to the glass. This will cause the handle to come loose.
